

CERTIFICATION FOR ENDURACORE
PRODUCED BY CONSULTO COLLECTION
LTD

CONSULTO sanitaryware is – in general terms – made from technologically advanced resin providing great strength, high insulation value and tough surface quality. This material is called EnDuraCore and other applications include boat hulls and car bumpers.

The sanitaryware and baths are produced by injection moulding. The surface finish, both front and back, is a NPG gelcoat, giving a durable finish which can be gloss or matt as required. Between these surface layers is a core of dense polyester resin mixed with mineral powders, which varies in thickness between 10 and 25mm according to the individual design. All components used in the production of EnDuraCore comply with current EU legislation. Gelcoat and resin material certification is available on request.

CONSULTO'S EnDuraCore sanitaryware is immensely strong and has great rigidity. It can be produced in any colour and with a wide range of decoration, if required. This decoration could include 23.5 carat gold leaf, silver leaf, swarovski crystals and any style of floral or geometric design digitally transferred on to the finest silk mousseline and incorporated within the EnDuraCore construction. There are many shapes and sizes of baths available, however, we are always pleased to discuss special production and custom made baths and sanitaryware.

Should a high-impact accident occur (for instance, during installation) the strength and integrity of the shell should not be compromised, and surface damage can be repaired in-situ. Because of the high insulation properties of the mineral/resin compound, the products retain heat (from the water) and feel comfortable to the touch.

EnDuraCore produced by CONSULTO complies with all current EU legislation. It is guaranteed against manufacturing defect for 10 years.
